* A fast and simple graphical utility designed for engineers as well as students who require a simple utility in order to create plots and analyze diagrams. The interface is easy to use and intuitive, making the data input process very simple, as the application allows for the import of various file formats (Tab delimited, Microsoft Excel, CSV, etc.) * FindGraph provides a wide selection of functions for creating charts and diagrams, such as scatter diagrams, line graphs, bar or polar plots, as well as functions based on a formula. * In addition to basic functions, the application provides support for the following types of graphs: 'Scatter' and 'Points Groups Diagrams', 'Points Density Distributions', 'Line Graphs' and 'Bar' or 'Polar' plots, each with its corresponding default settings. * The application features 200 functions with support for 'Polar', 'Cartesian' as well as 'Parametric' equations. Additionally, the user interface lets users change the settings for each type of plot, enabling them to, for instance, easily adjust the scales or grids. Also, users can work with 'Polar' equations using the 'Polar' coordinate method instead of the default 'Cartesian'. The application also includes a built-in conversion tool that enables users to change 'Polar' plots into 'Cartesian' ones. * FindGraph features two orientation methods, namely 'Graph-axis' and 'Cartesian-axis', allowing users to choose between the two coordinates and instantly see how it works. Likewise, the application includes built-in tips that explain each function in detail, helping users to use it intuitively. * After creating graphs, users can insert various comments and time-stamps into each plot, thus making it easy to identify and check the values of each axis. Moreover, it is possible to build functions using a 'formula', and then apply them to the created graph, for instance, the 'Astroid' formula, which calculates the area under an 'Astroid'. Also, users can work with formulas such as 'Ellipse', 'Hypocycloid', 'Plateau Curves' or 'Witch of Agnesi'. All functions are fully-customizable, including the relative parameters, and many of them can be used to analyze graphs with a certain degree of accuracy. For instance, the 'Hypocycloid' function can be used to determine the length of the perimeter and the area of a circle, as well

* Graphs & Diagrams FindGraph is an intuitive and fully-featured graphics tool designed for engineers as well as students who require a simple utility in order to create plots and analyze diagrams. The application features over 200 functions and provides users with support for 'Polar', 'Cartesian' as well as 'Parametric' equations. The user-friendly interface makes the data entry process very simple, as users can import various file formats into the application or simply copy / paste elements from other programs. They can also do it the old-fashion way, by manually entering the necessary data. FindGraph supports several types of graphs, such as 'Scatter' and 'Points Groups Diagrams', 'Points Density Distributions', 'Line Graphs' and 'Bar' or 'Polar' plots, all of which allow plenty of flexibility in the setup of scales and grids. Since FindGraph functions as a COM server, users can easily copy plots as Bitmap and paste them into word processors. Also, the created file can be saved to an image format or to a PDF file. In addition, users can insert various comments or date and time stamps into the plot. They can also build various functions based on a formula, then apply them to the created plot. Similarly, they can work with famous formulas, such as 'Astroid', 'Ellipse', 'Hypocycloid', 'Plateau Curves' or 'Witch of Agnesi' by inputting the required parameters

and translating them into X and Y coordinates. FindGraph provides users with a built-in conversion tool that enables them to turn 'Polar' plots into 'Cartesian' ones, by changing the coordinates from X and Y to W and Z, then adjust them to the new methods of calculation. Being both comprehensive and user-friendly, FindGraph can prove a great helper to professionals from several fields of activity, such as engineering, science and even finances, as it can easily assist them in creating graphs and diagrams, without much effort. Comparative and comparative analysis of files is challenging, not only because of the sheer volume of data but also because of many different and mostly incompatible file formats. They require a user to have a deep understanding of their pros and cons, as well as of the file formats and software required to access the data. Not to mention the increasing need to keep large collections of files in several different folders on multiple computers. CompareFiles supports all the most common file formats and can be used to compare text, binary and XML files. It works almost without restrictions and enables users to compare the content of files with ease. The application works with all Windows versions and can be used simultaneously on the desktop and/or as a portable application. Users can compare files right from their desktop and on the go, as they can easily view, copy and even add comments and filters to files using drag-and-drop operations, while saving the results to a text file, or even several files at once. CompareFiles is packed with useful features: it can compare single or multiple files, perform a complete comparison in batches, synchronize the clipboard between computers and synchronize a single file using any file format, as well as calculate differences and version differences between two or more files. CompareFiles is free, but if a user needs advanced features, they can upgrade to the extended edition, for \$24.95. Buy it from Softpedia and get 20% off the regular \$49.95 price! CompareFiles Description: ListCal is a spreadsheet-like, color-coded calculator that can help you work out all kinds of calculations at once. Using only a few keyboard shortcuts, you can solve problems of just about any complexity, no matter what program is used to access the data. Although developed mainly as a scientific and engineering tool, it can also be used to perform everyday calculations or to keep your personal finances organized and updated. A wealth of formulas enable users to create both simple and complex formulas, easily and without any programming knowledge. In addition to standard mathematical operations, the spreadsheet-like approach provides solutions for trigonometry, exponents, roots, radians, square root, multiples, division, percentages, ratios and more. These are entered using built-in shortcuts, so users can perform even complex operations in just a few clicks. The resulting formula can be saved and used for further calculations or can be copied to the clipboard, ready for use in other programs. ListCal also allows for quick repetition,
