Behzad Razavi Rf Microelectronics, Second Edition is an engineering textbook in the area of electromagnetic (EM) wave propagation, and its applications to communications, radar, and instrumentation. The book covers the mathematical and physical principles of the subject as they relate to the design of RF systems. Conceptual development begins with a review of basic concepts such as impedance, complex impedance, and reflection coefficients. Related topics are then covered in some detail, including impedance matching and gain modeling. The theory of a priori error analysis is then discussed in light of its application to RF circuits. The next major section, which is concerned with time-domain analysis, is covered at length in an effort to serve as a foundation for analysis in the time-frequency domain and applications in signal processing. The resulting design process is illustrated through a number of engineering examples. The final chapters cover the design of computer-aided systems, as well as the theoretical aspects of fully integrated circuits. In every chapter, a careful balance is struck between the mathematical and physical nature of the subject. This balance serves as a guide for the student and is crucial to the development of his or her own understanding. The text is written in a style that is concise and to the point, yet leaves room for those who

What is a good way to do this for a large number of files? I have not had much luck with the shell - never worked out how to pipe the list of files into the command. Thank you! A: If you have a Linux/Unix system, you can use xargs. In a terminal, do: for file in *.ppt; do echo \$file; cat \$file; done | xargs This can be done in a script called listofpfiles.sh and saved as filelist.sh, for example. Or you can use it in a Bash script named list_of_ppt_files like this: #!/bin/bash for file in *.ppt; do echo \$file; cat \$file; done | xargs Save it in /bin and make it executable. If you're on Windows, there's a solution at Effectiveness of single high-dose radiation for the management of metastatic bone cancer. Radiation therapy (RT) is rarely used to treat skeletal metastatic cancer. To evaluate the effectiveness of single high-dose RT with the aim of preventing skeletal-related events (SREs) in patients who have bone metastases of breast and prostate cancers. We selected 151 patients with symptomatic bone metastases of breast and prostate cancers from our oncology RT database. Patients were given single high-dose RT using an Accelerated Partial Irradiation (APR) treatment plan (20 Gy/5 fractions over 4-5 days) and were excluded for other active treatments within the six-month period prior to the RT. The primary endpoint was the number of SREs, and secondary endpoints included overall survival (OS), progression-free survival (PFS), pain relief, and safety of this RT regimen. The mean ± SD age of the 151 patients was 63.3 ± 10.3 years. The mean Eastern Cooperative Oncology Group (ECOG) performance status of the patients was 0.2 ± 0.6. Out of 151 patients, 76 (50%) had breast cancer and 75 (50%) had prostate cancer. SREs occurred in 63 (42%) of 151 patients. The median overall survival was 27.3 months. The median PFS was 11.1 months. Pain relief of
