Password Sniffer Console is a handy application, perfect for retrieving access credentials from various network devices. [More Info] Password Sniffer Console is a comprehensive piece of software whose main purpose resides in assisting you with the detection and capture of access credentials that pass through your LAN, be they for email accounts, web sites or FTP servers. Advanced CMD knowledge required The application does not have a GUI per se, and can only be run from CMD, meaning that you need to have at least some prior experience in working in command line. While the program offers some help documentation on how to best benefit from what it can, many people will probably think twice before using Password Sniffer Console, precisely because of the absence of a user interface. Recover passwords for your various accounts from network traffic The utility supports several different protocols, namely HTTP, FTP, POP3, IMAP and SMTP, being able to cover a large array of passwords that are used in the network, with just a few swift keystrokes. With the help of Password Sniffer Console, you can easily retrieve lost or forgotten access credentials for your email account, your favorite websites or your FTP servers, and can also serve penetration testers in their daily tasks. Once launched, it requires you to indicate the index of network devices. After selecting it, Password Sniffer Console will automatically begin retrieving passwords and display them as captured from the passing traffic, listing them in a queue. A command line tool to help you retrieve access keys All things considered, Password Sniffer Console proves to be an efficient yet rather demanding program that can assist penetration testers and other computer professionals in recovering access credentials from network traffic. Keymacro converts the mac address and index of a computer, into a username and password. The mac address can be from a network scanner or a file such as a text file. You can import the mac addresses and it will automatically create a user/pass combo for them. Extract Regex, Password, e-mail from HTML files Extract Regex, Password, e-mail from HTML files is an advanced utility designed to help users extract required information from HTML files in a convenient manner. This tool supports regular expressions in the format of one or more capturing groups. The application does not require any installation on the PC or server that you want to extract information from. Extract Regex, Password, e-mail from HTML files can extract email addresses, passwords and addresses from HTML files. It does this by looking for any links to other HTML files, in the same directory, and then creates a simple HTML file with links to the files, in a new directory, along with the data. Extract Regex, Password, e-mail from HTML files works well in a LAN environment, but does not work in a WAN environment. When run, it will create a new file in the same directory as the HTML file, which is then used to create a simple HTML file that has links to the various files that have been extracted from the original HTML. Heparin is a potent inhibitor of platelet aggregation and secretion. The mechanism by which heparin inhibits these processes is not well understood. In this study, we tested the hypothesis that heparin inhibits platelet aggregation by inhibiting conformational changes in the platelet receptor glycoprotein IIb/IIIa. We report that heparin inhibits ristocetin-induced platelet aggregation by an antibody-independent mechanism. Furthermore, heparin and the synthetic sulfated polysaccharides pentosan polysulfate and chondroitin sulfate blocked heparin-induced inhibition of ristocetin-induced platelet aggregation, suggesting that the heparin-induced conformational change is a common step in the inhibition of platelet aggregation by these three compounds. Although the polysaccharides pentosan polysulfate and chondroitin sulfate have similar structural requirements for their ability to inhibit platelet aggregation, heparin has a broader specificity, inhibiting ristocetin-induced platelet aggregation by a competitive interaction with an overlapping epitope on the platelet receptor glycoprotein IIb/IIIa. On the basis of these results, we propose that heparin blocks platelet aggregation by inhibiting a specific receptor-mediated conformational change associated with receptor occupancy.Protests against use of violence against women in the criminal justice system have been held across the country. Women and men rally in front of the Court House in Anchorage, Alaska, on Thursday. Photo: AFP (Beirut) – Scores of demonstrators gathered outside the courthouse in Anchorage, Alaska, on Thursday in a rally calling for an end to violence against women in the criminal justice system. Alaska state legislator Rep. Jonathan Kreiss-Tomkins organized the rally to show solidarity with victims of domestic violence and to appeal for "meaningful change" in the state's criminal justice system, according

Password Sniffer Console is an efficient CMD based application that was designed with the specific purpose of assisting people in recovering passwords for email accounts, web sites and FTP servers. The utility can also help you retrieve access keys used for your company's VPN connection. The program allows you to select a specific index of network adapters, which will then be examined for any data that is being passed through the network. The packets will be inspected, filtered and then saved in a queue. After that, the captured data is displayed in the main window, and you can use it to view each one of the access credentials with ease. The app also allows you to use wildcards and specify if you want to filter out data by protocol and application. All the information you need is right there on the interface, including the option to save the captured credentials for later use. Application Configuration The utility does not have a graphical user interface, and you must use the command line to run the application. All the tool offers to the user are just few pages of help. The application does not include any advanced option, but it does have a few very basic options that can help in simplifying the capture process. Advanced CMD knowledge required Each network adapter can have a different

index value. You can determine the value of the index by clicking on the little arrow to the left of each adapter, and can also find out which one is the latest one by selecting the "Latest" option, located at the top of the main window. Once the index has been determined, you can search for a specific network device using the command: Sniffer Console:index=indexName For example, if you want to discover only the IP addresses that belong to your web server, use the command: Sniffer Console:index=Index of index name:web. The index name will be: IP=192.168.1.100 - network adapter 1 IP=192.168.1.101 - network adapter 2 ... and so on. Capturing and storing passwords from network traffic The utility will start by creating a text file that will store the captured traffic. This file will be saved in the selected directory by default, and is only viewable by the person who created it. The file contains a list of URLs, IP addresses and the passwords that were captured from the captured traffic. With the exception of credentials that you set in the captured data, this file will only contain information about the URLs that are found in the captured data. You can view the file in Notepad with the following command: Sniffer Console:view=File. When you press the enter key, the data will be displayed in a table format, similar to the one shown below: So, once the captured data has been saved to a text file,
